Research question

What does publicly available evidence show about flood preparedness and early-warning systems in Dire Dawa, what cannot be verified from available evidence, and what information is needed for better local action?

Objectives

Identify and organize public evidence; assess the seven-stage preparedness chain; evaluate recency, geography, accessibility, method, actionability, and reusability; and identify decision-critical gaps requiring field validation.

Scope and ethics

This is a secondary public-evidence audit. It does not collect personal data, evaluate present-day system performance, rank communities, identify sensitive sites, or treat missing evidence as proof of absence.
